

Pre-Operative Instructions for Extractions and Oral Surgery

- Patients should consume a meal prior to the procedure.
- Adequate hydration is advised.
- Optimal vitamin D, C, and K levels are beneficial for post-operative healing.
- Due to the unpredictable duration of surgical procedures and the possibility of accommodating emergency cases, delays may occur.
- Patients are advised not to schedule other obligations on the day of the procedure.
- Surgical co-payments may vary depending on the tooth involved. Extractions requiring sectioning of the tooth and/or bone may incur higher costs than simple extractions.
- In some cases, alveoplasty (bone smoothing) may be required to promote favorable healing. This may also affect the final cost.
